

HEATLIGHT TECHNOLOGY

HLO75 IP23 Outdoor Heater

This new lightweight short wave infra-red heater is ideal for smaller installations outdoors where the heater is under cover. This makes it perfect for under parasols, under awnings, in marquees and in smoking shelters and gazebos.

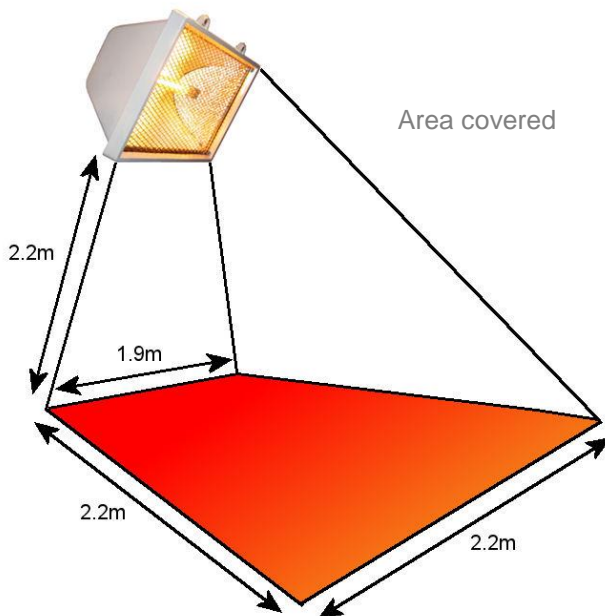

Efficiency

The heater is part of the new generation of heaters from Heatlight Technology where the accent is on running cost and low environmental impact.

At only 750 watts the heater consumes a low level of power; a typical hourly cost will be in the area of 7 pence.

Due to the open face technology and a special reflector, the heat radiated is equivalent to a much higher wattage old style glass fronted heater.

A further advantage of this heater is that the lamp is able to give at least 5,000 hours service before requiring replacement, more than 5 times the life of lamps in glass fronted heaters. These factors combined mean that this heater is ideal for commercial installations.

Applications for this product include:

- Patio Heating
- Parasols
- Farms
- Kennels
- Leisure facilities
- Garden Centres
- Sheds
- Garages

HLO75 - 220-240v 750w 3.25A
